6. After update, **restart** your computer.

#### **Method 5. Troubleshoot Windows problems by Running the Maintenance Tasks.**

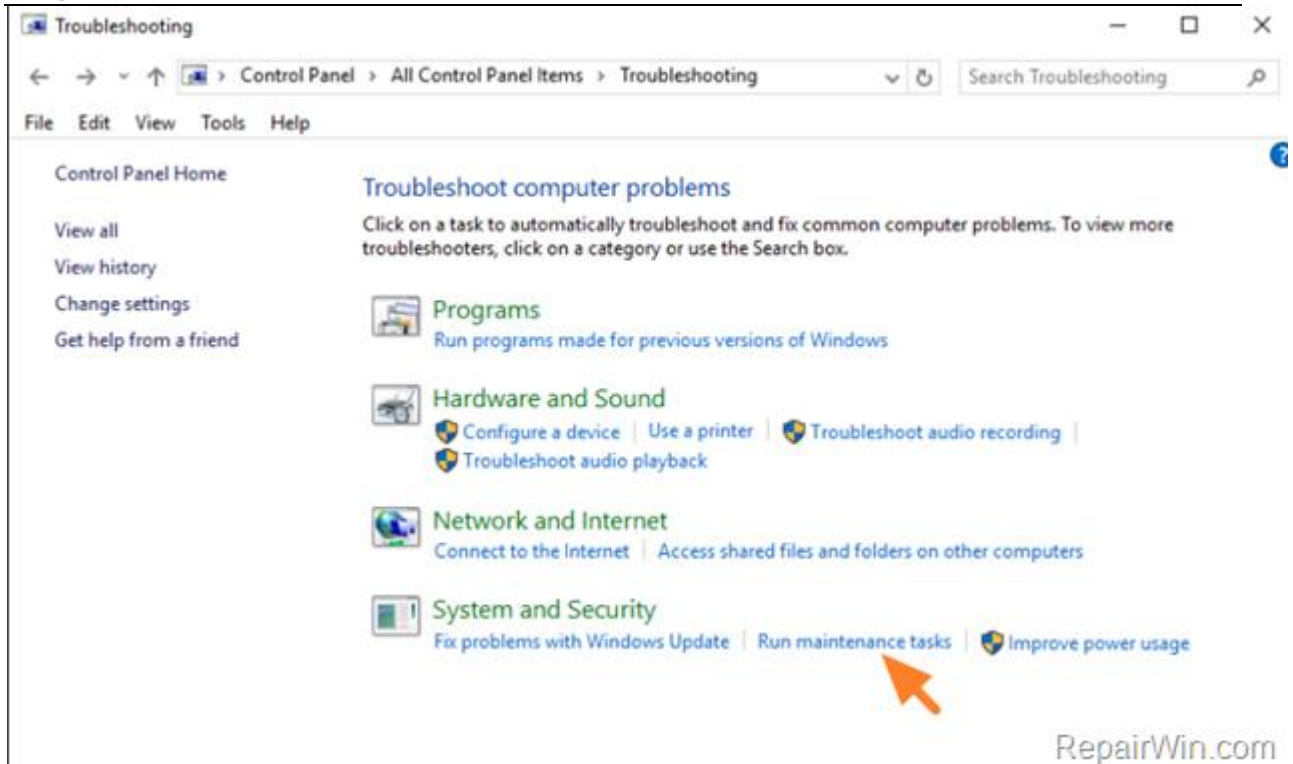

– You this method to troubleshoot several problems on your computer:

1. Right click to Start menu  and select **Control Panel**.

2. Open **Troubleshooting**.

\* {If you don't see the Indexing options, set the **View** (View by) to **Small icons**

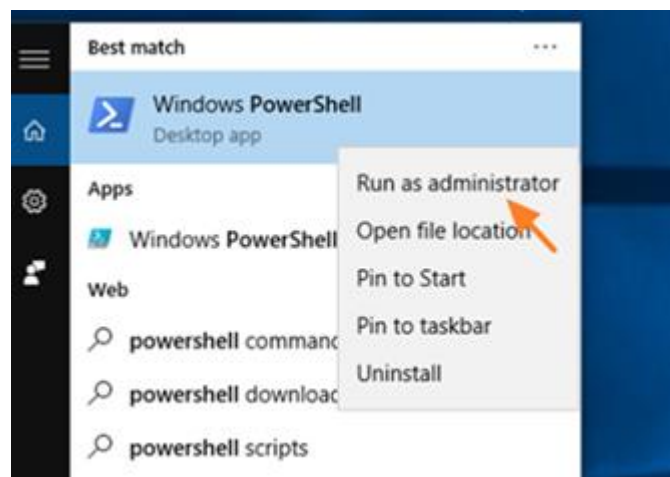

3. Under System and Security select **Run Maintenance Tasks**.

3. Press **Next** and then wait until the System Maintenance utility detecting problems.
4. Follow the on screen instructions to fix the problems found.

#### **Method 6. Re-register modern apps using PowerShell.**

1. At **Cortana**'s search box, type **powershell**
2. Right click on **Windows PowerShell** result and select **Run as administrator**.

1. Run the following command from PowerShell.

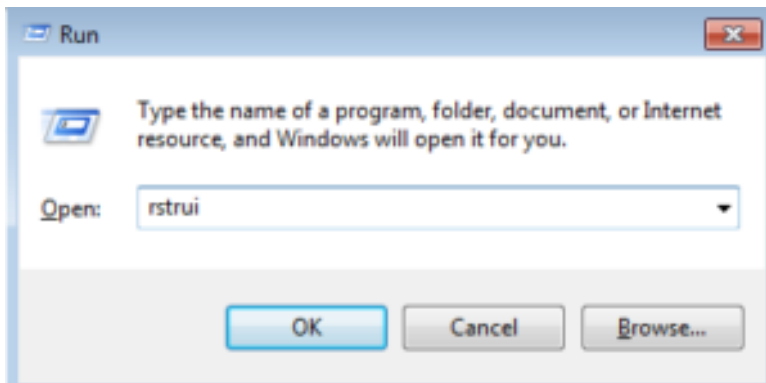

- `Get-AppXPackage | Foreach {Add-AppxPackage -DisableDevelopmentMode -Register "$($_.InstallLocation)\AppXManifest.xml"}`

2. **Restart** your computer.

### **Method 7. Restore your computer to previous working state.**

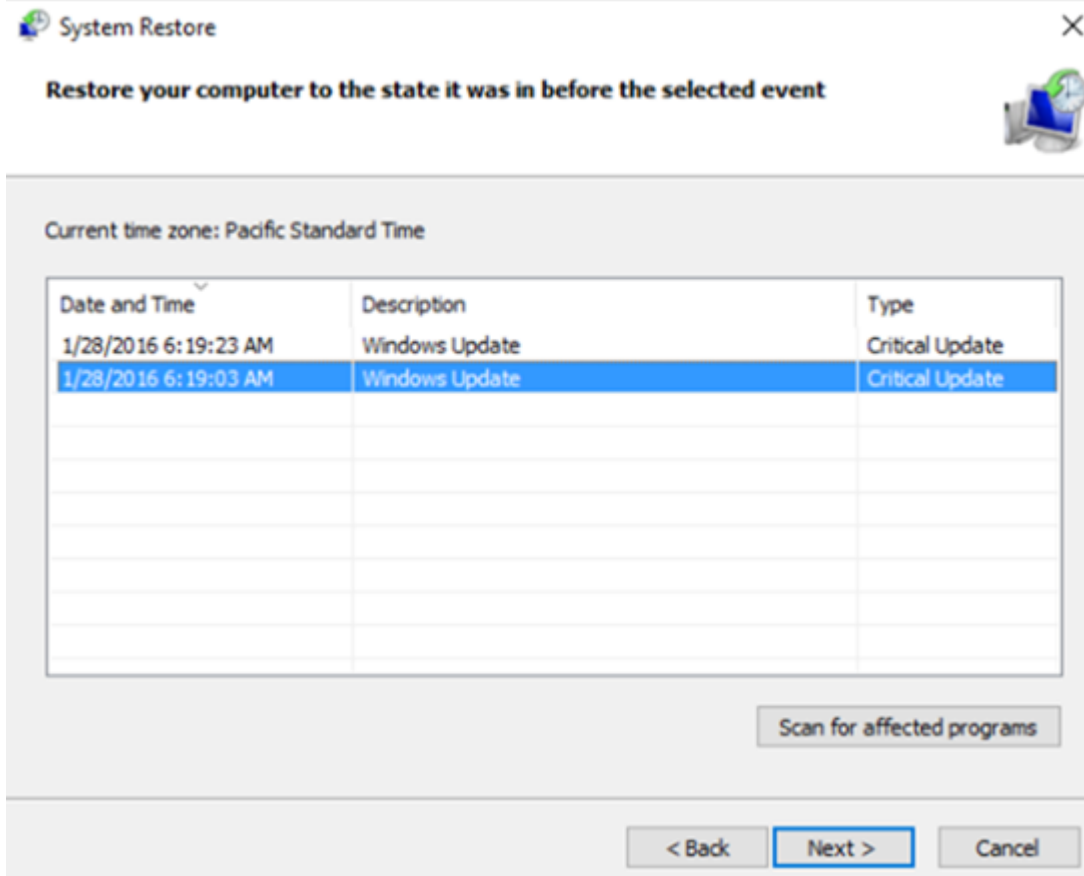

1. Right click on the Start button (Windows flag on bottom left corner) and choose **Run**,

2. Type **rstrui** & click **OK**.

3. Click **Next** at the first screen.

3. Choose an earlier date (that your computer is working normally) and then click **Next** to start the restore process.

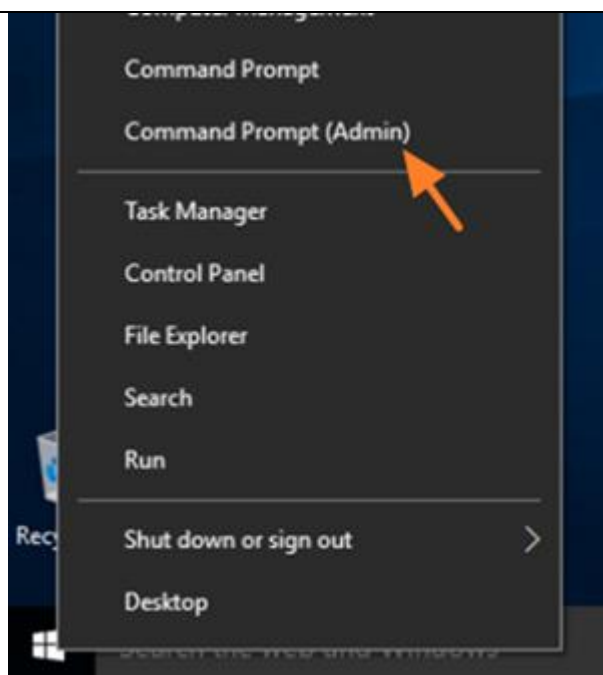

#### **Method 8. Create a new User Account on your computer.**

Use this method to create an new local account on your computer (with Administrative privileges) and sign-in with the new account.

If the Settings app or all other apps are working, then transfer your personal data from the old account to the new one.

1. Right click on Start menu (Windows Flag) and select **Command Prompt (Admin)**.

2. At command prompt window, type the following command to create a new user account\* on your computer and press **Enter**.

**net user %UserName% /add**

\* Replace the *%UserName%* with your preferred username:

e.g. if you want to create a new account with name “*User1*” then you have to give the command:

***net user User1 /add***

3. Then give this command to add the new user account to the Local Administrators Group:

**net localgroup administrators %UserName% /add**

e.g. If the new username is “*User1*” then you have to give this command:

***net localgroup administrators User1 /add***

4. Sign-out and logon with the new user.

### **Method 9. Perform a Windows 10 Repair Upgrade.**

If you still cannot launch Store Apps or Settings, then perform a repair upgrade of your Windows 10 installation by using the instructions mentioned in this article:
